Guidelines For Estimating Beef Grassing Costs Based on a 500 Head (Steers)

Date:

is also available to help

April, 2024

This guide is designed to provide you with planning information and a format for calculating costs of production of a grass cattle enterprise in Manitoba. General Department recommendations are assumed in using feed and veterinary inputs. These figures provide an economic evaluation of the livestock and estimated prices required to cover all costs. Costs include labour, investment and depreciation, but do not include management costs, nor do they necessarily represent the average cost of production in Manitoba.

Manitoba has an abundance of competively priced land suitable for pasturing cattle (ie. Community Pastures, Agricultural Crown Lands, private pastures, etc.). In this budget it is assumed that feeders are purchased in the spring and put in a feedlot for 60 days prior to being placed on pasture for an additional 90 days.

These budgets may be adjusted by putting in your own figures. As a producer you are encouraged to calculate your own costs of production. Good management is assumed in that a balanced ration is being fed, livestock are on a herd health program and handling facilities are included.

Assumptions

- 1. Gross Average daily gain (ADG) is assumed to be 2 lbs/day. Net ADG is 1.64 lbs/day.
- 2. It is assumed that the feeder steer weighs in at 600 lbs. and is raised to 900 lbs. (846 lbs. after 6% shrink).
- 3. Cattle are on feed for 150 days; the first 60 days in a feedlot and the remaining 90 days on pasture.
- 4. Assumed 500 head of cattle on feed and pasture.
